Report Overview & Storytelling Framework

This document is the complete guide for building and narrating the Lumina Mart Power BI report. Each page section explains: (1) the business question the page answers, (2) the exact visuals and field configurations, and (3) the story the viewer should leave with.

The Story Arc Across All Pages

The 8-page report follows a deliberate narrative flow from macro to micro:

#	Page	Business Question Answered
1	Executive Overview	Are we healthy overall? Revenue, profit, YoY growth at a glance.
2	Product Analysis	Which products and brands drive profit and which carry risk?
3	Sales Performance	Who are our best reps and which areas/segments lead?
4	Promotions Analysis	Do promotions actually work? Are they growing revenue or eroding margin?
5	Returns & Quality	Where are products being returned and what is the financial damage?
6	Returns & Quality 2	Which complaint categories are most frequent and when do returns spike?
7	RFM	Who are our best customers and who is at risk of churning?
8	Customer Insights	What do customers say about us in surveys? Voice of the customer.

Page 1 — Executive Overview

Business Question

Are we a healthy, growing, profitable business overall?

This is the entry point of the report. The viewer should be able to answer the top-level health question in under 10 seconds. Every visual feeds into a single verdict: the Revenue Health Score.

The Storytelling Sequence

- 1. Eyes land on the 5 KPI cards at the top — instant snapshot of scale and health.
- 2. Target Achievement gauge — are we hitting our goal this year?
- 3. Revenue Health Score gauge — the single composite score (0.78, Amber).
- 4. Total Net Sales by Area donut — is revenue balanced or concentrated?
- 5. Sales Trend combo chart at bottom — monthly rhythm and moving average.

Visual Configuration

KPI Cards Row (5 cards)

Field Well	Table	Field / Measure	Notes
Card 1	Fact_Sales	Total Profit	26M EGP — rename label to 'Total Profit'
Card 2	Fact_Sales	Profit Margin %	22.01% — rename label to 'Profit Margin'
Card 3	Fact_Sales	Net Sales YoY %	50.15% — rename label to 'Net Sales YoY %'
Card 4	Fact_Sales	Return Rate %	0.36% — rename label to 'Return Rate %'
Card 5	Fact_Sales	Net Revenue After Returns	108M EGP — rename label

Target Achievement Gauge

Field Well	Table	Field / Measure	Notes
Value	Fact_Sales	Total Net Sales	116.12M EGP — current value
Target Value	Fact_Sales	Sales Target (if exists)	Set manually to 127.73M if no measure exists
Min/Max	—	0 / 130M	Set in Format pane → Gauge axis

Revenue Health Score Gauge

Field Well	Table	Field / Measure	Notes
Value	Fact_Sales	Revenue Health Score	Returns 0.78 (Amber). Fixed from earlier session.
Min	—	0.00	Set in Format pane
Max	—	1.55	Set in Format pane
Color (Conditional)	Fact_Sales	Revenue Health Color	Bind to gauge fill color via conditional formatting

Story Insight

Score of 0.78 is Amber — meaning the business is performing well but not at peak. The viewer is immediately prompted to look deeper. This creates narrative tension that pulls them into the next pages.

Total Net Sales by Area — Donut Chart

Field Well	Table	Field / Measure	Notes
Legend	Dim_Area	Area	5 areas: Cairo, Ismailia, Giza, Suez, Alexandria
Values	Fact_Sales	Total Net Sales	Shows EGP amount + percentage on each slice
Tooltips	Fact_Sales	Return Rate %	Hover reveals return rate per area

Story Insight

Revenue is almost perfectly balanced across all 5 areas (18–21% each) — no dangerous geographic concentration. Suez has the highest return rate (0.50%) despite average revenue.

Sales Trend — Combo Chart (Bar + Line)

Field Well	Table	Field / Measure	Notes
X Axis	Dim_Date	Month Name	January → December
Column Y Axis	Fact_Sales	Net Revenue Actual	Yellow bars
Line Y Axis	Fact_Sales	3M Moving Avg Sales	Teal line — smooths seasonality

Story Insight

September shows a clear dip to 3.1M moving average. This is the story trigger — viewers are prompted to investigate whether this is seasonal or a structural issue.

Page 2 — Product Analysis

Business Question

Which products and brands should we invest in — and which are liabilities?

This page bridges the top-level health overview into product-level decisions. The viewer should leave knowing which brands are most profitable AND which products carry return risk.

The Storytelling Sequence

- 6. Profitability by Brand (bar chart) — which brands earn the most margin?
- 7. Product Performance & Risk Analysis (scatter) — map each product on profit vs return risk.
- 8. Market Share by Product Category (100% stacked bar) — how does brand share vary by product?

Visual Configuration

Profitability by Brand — Horizontal Bar Chart

Field Well	Table	Field / Measure	Notes
Y Axis	Dim_Brand	Brand	8 brands: Danone, President, Beyti, Domty, Dina Farms, Panda, Juhayna, Almarai
X Axis	Fact_Sales	Avg Profit Margin %	Shows percentage on each bar
Data Labels	—	On	Format pane → Data labels → On

Story Insight

Danone leads at 22.91%, Almarai is lowest at 21.72% — but the range is tight (only ~1.2% spread). This tells us product mix matters more than brand choice for margin optimization.

Product Performance & Risk Analysis — Scatter Chart

Field Well	Table	Field / Measure	Notes
Values (Details)	Dim_Product	Product	One dot per product category
X Axis	Fact_Sales	Total Net Sales	Horizontal = revenue size
Y Axis	Fact_Sales	Return Rate %	Vertical = return risk
Size	Fact_Sales	Avg Profit Margin %	Bubble size = margin quality

Story Insight

Cheese appears top-right: highest revenue AND highest return rate. This is the key tension in the product story. Butter sits bottom-left: low revenue, low returns. Yogurt and Milk are balanced performers.

Market Share by Product Category — 100% Stacked Bar

Field Well	Table	Field / Measure	Notes
Y Axis	Fact_Sales	Product_Category	7 categories (Yogurt Cup, White Cheese, Milk 500ml etc.)
X Axis	Fact_Sales	Total Net Sales	Normalized to 100%
Legend	Dim_Brand	Brand	8 brands shown as color segments
Data Labels	—	On	Show percentage inside each segment

Story Insight

No single brand dominates any product category — maximum brand share is ~22%. This shows a highly competitive, fragmented market where Lumina Mart carries risk exposure across all brands equally.

Page 3 — Sales Performance

Business Question

Who are our top reps, which areas perform best, and where are we growing vs. last year?

The Storytelling Sequence

- 9. Total Orders and Total Profit by Sales Rep (lollipop) — rep-level output.
- 10. Rep Ranking bar chart — formal rank 1–5.
- 11. Total Net Sales vs Last Year by Month (combo) — YoY comparison month by month.
- 12. Total Profit by Month (waterfall) — cumulative profit build across the year.
- 13. Sales Performance by Segment and Sales Rep (stacked bar) — who sells to which customer type.
- 14. Adjusted Rating by Area (bar) — how customers rate service quality per area.

Visual Configuration

Rep Ranking — Bar Chart

Field Well	Table	Field / Measure	Notes
Y Axis	Dim_SalesRep	Sales_Rep	5 reps: Karim Nabil, Mona Hassan, Sara Mostafa, Ahmed Samy, Omar Adel
X Axis	Fact_Sales	Sales Rank by Sales Rep	Rank measure (1=best). Sort ascending so rank 1 appears at bottom.
Data Labels	—	On	Shows the rank number on each bar

Story Insight

Karim Nabil leads in revenue (23.7M EGP) but Omar Adel is ranked #5 by the ranking measure. This reveals the rank is multi-dimensional — not purely revenue-based, which adds richness to the rep story.

Total Net Sales vs Last Year — Clustered Bar + Line

Field Well	Table	Field / Measure	Notes
X Axis	Dim_Date	Month Name	Full year
Column Y Axis	Fact_Sales	Total Net Sales	Current year bars (gold)
Line Y Axis	Fact_Sales	Sales LY	Last year line (teal) — September 2025 drops to 0.9M vs prior

Story Insight

Field Well	Table	Field / Measure	Notes
			September 2025 shows only 0.9M vs 10M the prior year — this is the biggest anomaly in the dataset. It appears in multiple pages. Consider adding a text annotation explaining whether this was a data issue or a real business event.

Adjusted Rating by Area — Bar Chart

Field Well	Table	Field / Measure	Notes
X Axis	Dim_Area	Area	5 areas sorted by rating descending
Y Axis	Fact_Sales	Adjusted Rating	Fixed in this session — Suez 5.2 (best), Cairo 3.2 (lowest)
Data Labels	—	On	Show rating value on each bar
Tooltips	Fact_Sales	Return Rate %	Let viewer see if low rating correlates with high returns

Story Insight

Suez has the best customer rating (5.2) but also the highest return rate (0.50%). Cairo has the worst rating (3.2) but a low return rate. This counter-intuitive finding is a powerful story moment.

Page 4 — Promotions Analysis

Business Question

Are our promotional campaigns generating real incremental revenue or just eroding margin?

The Storytelling Sequence

- 15. 4 KPI cards — offer vs. organic split, conversion rate, and uplift.
- 16. Offer vs. Standard Sales (bar) — promoted vs. non-promoted revenue volume.
- 17. Profit Impact waterfall — does having an offer increase or decrease profit?
- 18. Campaign vs. Organic Baseline line chart — which months had campaigns and did they lift sales?

Visual Configuration

KPI Cards Row (4 cards)

Field Well	Table	Field / Measure	Notes
Card 1	Fact_Sales	Offer Revenue Share %	53.27% — more than half of revenue is promotion-driven
Card 2	Fact_Sales	Organic Revenue Share %	46.73% — organic baseline
Card 3	Fact_Sales	Promotion Conversion Rate	68.97% — of customers exposed to offer, 69% convert
Card 4	Fact_Sales	Offer Uplift Sales	5M EGP — incremental revenue vs. no-offer baseline

Profit Impact — Waterfall Chart

Field Well	Table	Field / Measure	Notes
Category	Fact_Sales	Has_Offer	True / False — two bars showing profit with and without offer
Y Axis	Fact_Sales	Total Profit	True=14M EGP, False=12M EGP — offers DO improve profit

Story Insight

Orders WITH an offer generate 14M profit vs 12M without — a 16.7% profit uplift. This directly answers the business question: promotions are not eroding margin, they are expanding it.

Campaign vs. Organic Baseline — Line Chart

Field Well	Table	Field / Measure	Notes
X Axis	Dim_Date	Month Name	Full year

Field Well	Table	Field / Measure	Notes
Line 1	Fact_Sales	Campaign Period Sales	Yellow — months with active promotions
Line 2	Fact_Sales	Normal Period Sales	Teal — baseline organic months

Story Insight

January (5.69M) and August–September (5.62M) are the strongest campaign months. The gap between campaign and organic lines widens in H2, suggesting promotions become more effective later in the year.

Page 5 — Returns & Quality

Business Question

How much revenue are we losing to returns and which products and brands drive complaints?

The Storytelling Sequence

- 19. Stock Status table — inventory health baseline before discussing returns.
- 20. Expiry Risk chart — near-expiry orders by product (Yogurt highest risk).
- 21. Financial Impact of Product Returns pie chart — return value split by product. (Fixed this session: was blank due to integer vs text bug in Total Return Value.)
- 22. Top Brands by Complaint Frequency bar chart — which brands generate the most complaints?

Visual Configuration

Financial Impact of Product Returns — Pie Chart

Field Well	Table	Field / Measure	Notes
Legend	Dim_Product	Product	Cheese, Butter, Milk, Yogurt
Values	Fact_Sales	Total Return Value	7.67M EGP total. Fixed: was comparing integer Return_Status to text 'returned'. Now uses ID=2.
Data Labels	—	Category + Value	Format pane → Detail labels → show both name and EGP amount
Tooltips	Fact_Sales	Return Rate %	Hover shows return rate per product

Story Insight

Cheese accounts for 61.7% of total return value (4.73M EGP) despite being ~25% of products. This is the critical quality risk in the portfolio and directly connects back to the scatter chart on Page 2.

Top Brands by Complaint Frequency — Horizontal Bar Chart

Field Well	Table	Field / Measure	Notes
Y Axis	Dim_Brand	Brand	Sort by value descending
X Axis	Fact_Sales	Orders With Complaints	Fixed this session: was comparing integer to text 'No Complaint'. Now uses ID<>3.
Data Labels	—	On	Show order count on each bar
Filters	Dim_Complaint	Complaint_Category	Slicer on page filters this visual dynamically

Story Insight

Field Well	Table	Field / Measure	Notes
			Dina Farms (1,520), Juhayna (1,519), and Almarai (1,512) are nearly tied at the top. This suggests a systemic issue rather than a brand-specific problem — possibly cold chain or delivery quality affecting all brands equally.

Page 6 — Returns & Quality 2

Business Question

What types of complaints dominate, and when do return rates spike during the year?

The Storytelling Sequence

- 23. Complaint Breakdown bar chart — which complaint type is #1?
- 24. Return Rate % by Month line chart — when during the year are returns highest?

Visual Configuration

Complaint Breakdown — Bar Chart (show Dim_Complaint names, not IDs)

Field Well	Table	Field / Measure	Notes
Y Axis	Dim_Complaint	Complaint_Category	Use Dim_Complaint[Complaint_Category] NOT Fact_Sales[Complaint_Category] — the latter shows integer IDs
X Axis	Fact_Sales	Complaint Breakdown Distribution	Fixed this session: integer comparison bug resolved. Shows % share per category.
Filter	Dim_Complaint	Complaint_Category <> 'No Complaint'	Add a visual-level filter to exclude ID=3 (No Complaint)
Data Labels	—	On	Show percentage on each bar

Story Insight

Category 1 (Pricing Issue) represents 63.75% of all complaints, Category 2 (Wrong Order) is 29.68%. Together these account for 93% of complaints. All quality-related fixes should focus on pricing transparency and order accuracy.

Return Rate % by Month — Line Chart

Field Well	Table	Field / Measure	Notes
X Axis	Dim_Date	Month Name	January → December
Y Axis	Fact_Sales	Return Rate %	Percentage line with data labels on each point
Data Labels	—	On	Show exact % on each data point

Story Insight

Return rates peak in August–September (0.54%) and are lowest in December (0.18%). This seasonal pattern likely reflects summer heat affecting dairy product quality during transport — a supply chain story worth highlighting to operations.

Page 7 — RFM Customer Analysis

Business Question

Who are our most valuable customers and who needs attention before they churn?

RFM stands for Recency, Frequency, Monetary. Each customer gets a score from 1–5 on each dimension. A score of 555 = the perfect customer (HyperOne). The page answers: where should account management focus its energy?

The Storytelling Sequence

- 25. 4 KPI cards — total customers, champions, loyal, average score.
- 26. Segment distribution donut — what % of customers are in each tier?
- 27. Customer revenue bar chart — ranked list showing segment color coding.
- 28. Scatter chart (bubble map) — the centrepiece: frequency vs. monetary with segment colors.

Visual Configuration

KPI Cards Row (4 cards)

Field Well	Table	Field / Measure	Notes
Card 1	RFM	RFM Total Customers	17 total customers in model
Card 2	RFM	RFM Champions Count	1 customer (HyperOne, score 555)
Card 3	RFM	RFM Loyal Count	6 customers in Loyal segment
Card 4	RFM	RFM Avg Score	533 average — overall healthy customer base

Segment Distribution — Donut Chart

Field Well	Table	Field / Measure	Notes
Legend	RFM	Segment	Champions, Loyal Customers, New Customers, Others
Values	RFM	RFM Total Customers	Count per segment: New=7(41%), Loyal=6(35%), Others=3(18%), Champions=1(6%)
Tooltips	RFM	RFM Avg Score + RFM Monetary	Show average score and total monetary on hover

Story Insight

41% of customers are 'New' — the largest segment. This means the business is acquisition-heavy. The key risk: if these new customers do not graduate to Loyal, future revenue is at risk. Account management should focus on converting new customers.

Customer Revenue Bar Chart — Horizontal Bar

Field Well	Table	Field / Measure	Notes
Y Axis	RFM	Customer Name	All 17 customers by name (calculated column)
X Axis	RFM	RFM Monetary	Total spend per customer in EGP
Legend	RFM	Segment	Color bars by segment — Champion=teal, Loyal=dark, New=gold, Others=gray
Tooltips	RFM	RFM Score + RFM Segment Label + RFM Frequency + RFM Recency Days	Full context on hover

Story Insight

HyperOne (27.1M EGP) is in a league of its own — double the next customer El Mahmal (14M EGP). This concentration risk means losing HyperOne alone would reduce revenue by 23%. This is a critical finding for account management.

Customer Positioning Map — Scatter Chart

Field Well	Table	Field / Measure	Notes
Values	RFM	Customer Name	One bubble per customer
X Axis	RFM	freq (Sum)	Order frequency — horizontal position
Y Axis	RFM	montary (Sum)	Total revenue — vertical position
Size	RFM	RFM Score Numeric	Fixed measure: R*100+F*10+M — bigger bubble = better overall score
Legend	RFM	Segment	Color by segment
Tooltips	RFM	RFM Segment Label + RFM Score + RFM R/F/M Scores + RFM Monetary	Full breakdown on hover

Story Insight

HyperOne sits alone top-right (highest frequency AND highest monetary) — the undisputed Champion. Aman and Kazyon sit far right (very high frequency) but low on Y axis (low monetary) — these are high-volume, low-value customers. A potential pricing or product mix conversation.

Page 8 — Customer Insights (Survey)

Business Question

What do our customers say about us? What drives their purchasing decisions?

This page uses Fact_Survey data — direct customer voice. It complements the transactional data on other pages with qualitative context.

The Storytelling Sequence

- 29. Purchasing Decision Factors (bar) — what matters most to customers when buying?
- 30. Monthly Spending (bar) — spending bracket distribution across the customer base.
- 31. Brand Loyalty under Price Increase (pie) — would customers stay if prices rise?
- 32. Offers vs Purchasing Decision (waterfall) — does offering promotions change the purchase decision?
- 33. Best Brand (bar) — which brand do customers spontaneously name as best?

Visual Configuration

Purchasing Decision Factors — Horizontal Bar

Field Well	Table	Field / Measure	Notes
Y Axis	Fact_Survey	Main Purchase Reason (Arabic)	Quality, Brand Trust, Taste, Price, Availability
X Axis	Fact_Survey	Count of Customer_ID	Quality leads at 43 mentions
Slicers	Dim_Customers_Survey	Age Group + Governorate	Top-right slicers filter the entire page

Story Insight

Quality (43) and Brand Trust (28) are the top two factors — together accounting for 59% of purchase drivers. Price is only #4. This means Lumina Mart should invest in quality assurance over price discounting to retain customers. Directly contradicts the common assumption that dairy buyers are price-sensitive.

Brand Loyalty under Price Increase — Pie Chart

Field Well	Table	Field / Measure	Notes
Legend	Fact_Survey	Brand Loyalty Response	Yes (stay), No (leave), Sometimes (depends)
Values	Fact_Survey	Count of Customer_ID	Sometimes=47(42%), No=34(30%), Yes=31(28%)

Story Insight

Field Well	Table	Field / Measure	Notes
			Only 28% of customers would stay if prices rise. 42% say 'sometimes' — they are persuadable. This means price increases must be communicated carefully and accompanied by quality or service improvements to retain the 42% swing segment.

Session Fixes Summary

The following measures were fixed or created during the May 2026 Power BI session:

Measure	Table	Root Cause	Fix Applied
Final Customer Rating	Fact_Sales	SWITCH on integer Customer ID vs text names	Changed to SELECTEDVALUE(Dim_Customer[Customer])
Revenue Health Score	Fact_Sales	Cascaded error from Final Customer Rating	Fixed upstream. Now returns 0.78.
Adjusted Rating	Fact_Sales	SWITCH on integer Area ID vs text names	Changed to SELECTEDVALUE(Dim_Area[Area])
Orders With Complaints	Fact_Sales	Integer Complaint_Category compared to 'No Complaint' text	Changed to <> 3 (integer ID of No Complaint)
Complaint Breakdown Distribution	Fact_Sales	Same integer vs text on IF and FILTER	Changed both conditions to use ID=3
Total Return Value	Fact_Sales	TRIM(LOWER(...)) = 'returned' on integer Return_Status	Changed to Return_Status = 2 (integer ID of Returned)

New measures created this session: RFM Segment Label, RFM Score, RFM Recency Days, RFM Frequency, RFM Monetary, RFM R/F/M Score (tooltip), RFM Total Customers, RFM Champions Count, RFM Loyal Count, RFM Avg Score, RFM Score Numeric.
